

## Active Voltage Conditioners

### 7.14 PCS100 AVC-40

Industries in developed countries, with modern power networks, are not immune to voltage problems. Although utilities endeavor to supply reliable, high-quality power, voltage sags and surges will continue to be a fact of life.

01 PCS100 AVC-40  
Single line diagram

The PCS100 AVC-40 is an active voltage conditioner. It is a high performance power electronic system designed for industrial and large commercial applications. It responds instantly to power quality events, providing continuous regulation of voltage.

With high power capacity, the PCS100 AVC-40 is the perfect solution for industrial loads using significant power as well as large commercial buildings where continuity of service is paramount. The PCS100 AVC-40 is designed to target voltage sag events while also providing protection against swells. Sag events are the major cause of lost production.

#### Key benefits

##### Reduce the cost of sag events

The PCS100 AVC-40 closes the electrical compatibility gap between the supply and plant by protecting the load from utility induced voltage sag events. The PCS100 AVC-40 minimizes the undue stress to the expensive equipment, thus increasing the equipment lifetime.

#### Improve plant operation

The PCS100 AVC-40 regulates the voltage, removing long term undervoltage, overvoltage and voltage imbalance to reduce waste and damage to the expensive equipment. It also removes voltage fluctuations, which can cause process variation, improving the quality of operation of the plant or the facility.

#### Faster return on investment

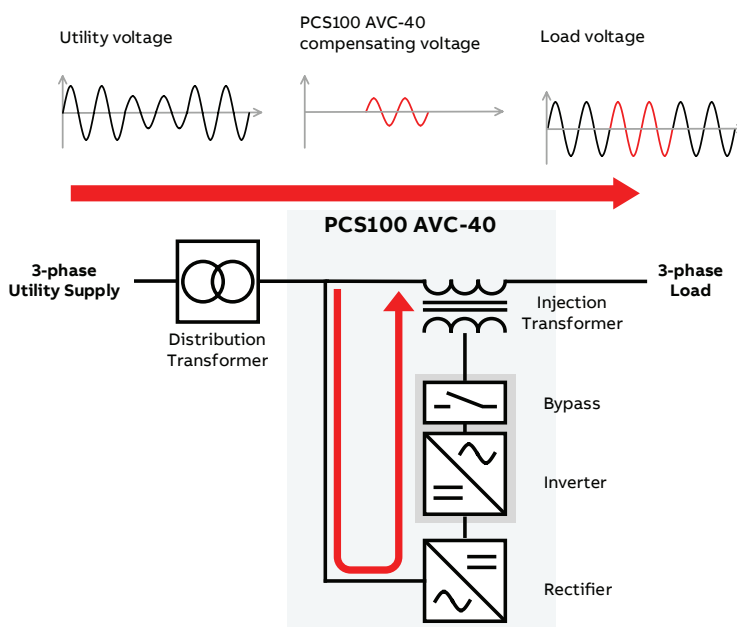

With industry leading efficiency exceeding 98 percent the PCS100 AVC-40 requires minimal costs for electricity and cooling. With no energy storage the ongoing maintenance cost is minimized, resulting in low total cost of ownership.

#### Reduce damage to equipment

The PCS100 AVC-40 protects expensive equipment by regulating the voltage to remove long term undervoltage, overvoltage and voltage imbalances.

#### Key features

- No energy storage
  - Increased system reliability with minimized maintenance
- Very high efficiency
- Continuous online regulation
- Industrial design
- Small footprint
  - Industry leading power density
- Regenerative load support
- Internal bypass
  - Redundant internal bypass design
- Connectivity
  - Ethernet
  - Modbus TCP
  - Integrated web server
  - E-mail notifications
- Multilingual graphical touch screen interface

## Static Frequency Converter

### 7.15 PCS100 SFC - 125 kVA to 10 MVA

PCS100 Static Frequency Converters are commonly used to interconnect 50 Hz and 60 Hz systems.

01 PCS100 SFC diagram

ABB's PCS100 Static Frequency Converter allows the interconnection of grid systems with varying frequencies, offering the ideal solution for shore to ship, plant relocation and testing facility applications.

#### User benefits

- Minimize operating and maintenance costs
- High reliability provides maximum power availability
- Keeps equipment running through utility voltage sags and frequency variation
- N+1 modular redundancy for mission critical applications
- Lowest total cost of ownership
- Minimal spares required
- Easy paralleling to other voltage sources using droop

#### Key product features

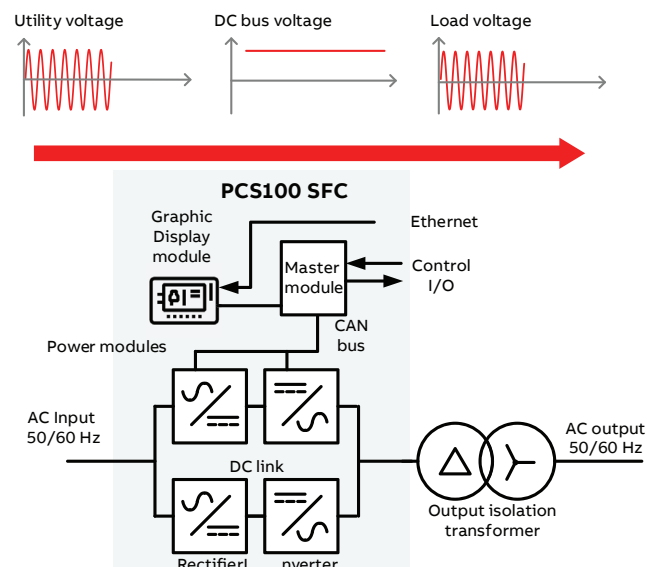

- High efficiency power conversion
- Clean sinewave output voltage
- Unity power factor, sinewave, active rectifier design
- Built-in module redundancy without interruption of operation
- Fully isolated AC connection using an output transformer
- Wide range of voltages available; 50 Hz and 60 Hz
- Small footprint design
- Touch screen colour graphic display (GDM)
- Internal web server and Modbus TCP allows remote monitoring
- Output cable voltage drop compensation
- Seamless generator change over standard (synchronization)
- Generator emulation and load sharing
- Power flow control
- Extensive remote control with extend I/O card

#### How it works

The system is constructed of multiple power electronic modules and functions by converting the input AC power through a sine-wave rectifier to a DC link, and then through an AC sine-wave inverter to produce a clean, full sine-wave output at the new frequency and voltage.

The PCS100 SFC is extremely flexible in terms of paralleling with other voltage sources, either generators or multiple SFC units. Parallel load sharing is achieved using frequency and voltage droop profiles programmed into the converter. This allows the converters to share power with other systems without the need for any additional communication signals.

Starting the SFC into the live bus is greatly simplified due to the automatic output synchronization feature. This enables a full seamless transfer from generator supply to SFC supply on the output bus. If the output bus is dead when the SFC is given a start command it will ramp up the voltage over one second, providing a soft energizing of the output.
